

Manastu Space Technologies Pvt. Ltd

MANASTU SPACE

At Manastu Space we believe that space has the potential to solve problems threatening the earth. However, the increased debris pollution has rendered space unsafe for satellites and astronauts.

We are developing an agile, safe, efficient, and affordable Green Propulsion system for safeguarding satellites and the trillion \$ space industry from the danger posed by space debris.

We have come up with 3 major innovations- 1. high-performance fuel, 2. reliable and efficient engine to burn the fuel and 3. ultra-high temperature catalyst.

We are also working on providing in-space refuelling services of our proprietary MS289 propellant to our customers in the future to further increase the life of their satellites. We will set up a fuel station in space and later use the same tank to provide De-orbiting services for the satellite at the end of its life. Thus, providing a complete end-to-end solution to our customers.

We are looking to connect with companies we can partner with in the long run.
